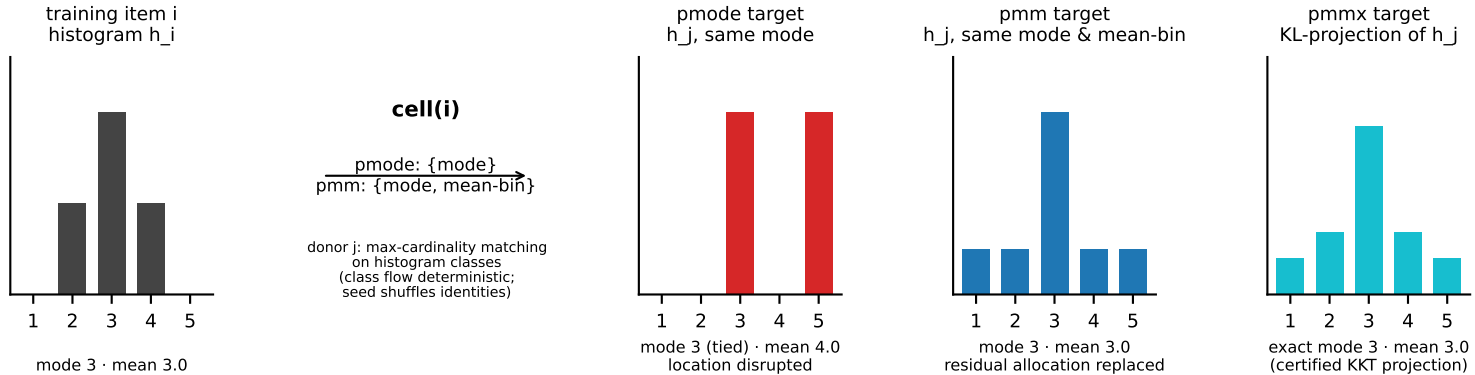
Fig. 1 Statistic-preserving donor replacement (schematic; illustrative histograms)



Certificate reported beside every contrast: support = fraction of items in cells with ≥ 2 histogram classes (upper bound) · changed fraction (realised) · TV among changed items · TV over all items · zero-TV donor pairs (= 0 before projection) · post-projection dose (pmmx)
Contrast = RPS(arm) − RPS(soft) on held-out annotation positions, same split and RNG stream; estimates the average predictive consequence of the realised replacement conditional on learner, split, realisation, assignment rule and dose — not the intrinsic value of the removed information.
